

DX9 Brake Mix by Andy Kunz

I want to only be able to apply my electric brakes (on EDF), with my down elevator stick and when the throttle is at idle. This way, the battery should only power the brakes when I'm landing and on the runway.

Thanks a lot,
Howard (howieal)

Set up a curve mix of ELE > brakes. Make it so that the starting point for the braking is where you want them to begin to engage, and make the travel from there to the end so it maxes. Leave Expo turned off. Set the switch to throttle stick, and have it active only in Pos 2.

Go to Digital Switch Setup and define Pos 2 to be the (elevator) stick position where you want braking to begin (I suggest at least 5%).

Andy
